

- 1) Print unique sorted array ☞ Accept data in sorted order having duplicate value. You need to print unique array using single loop . Unique sorted array using 1 loop

Input☞ 1 1 2 2 2 5 output☞1 2 5

```
package mypack;
```

```
public class Fourth_Test
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        int arr[] = {1,1,2,2,2,3,4,5,6,6,7,7,7,8};
```

```
        int previous = Integer.MIN_VALUE;
```

```
        for(int i=0;i<arr.length-1;i++)
```

```
        {
```

```
            if(arr[i]!=previous)
```

```
            {
```

```
                System.out.println(arr[i]);
```

```
            }
```

```
            previous = arr[i];
```

```
        }
```

```
    }
```

```
}
```

- 2) To find the maximum sum of all subarrays of size K: Given an array of integers of size 'n', Our aim is to calculate the maximum sum of 'k' consecutive elements in the array. Input : arr[] = {100, 200, 300, 400}, k = 2 Output : 700

```
package mypack;
```

```
public class Fourth_Test
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        int arr[] = {100, 200, 300, 400};
```

```
        int k = 2;
```

```
        int max_sum = 0;
```

```
        for(int i=0;i<k;i++)
```

```
        {
```

```
            max_sum+=arr[i];
```

```
        }
```

```
        int window_sum = max_sum;
```

```
        for(int i=k;i<arr.length;i++)
```

```
        {
```

```
            window_sum += arr[i] - arr[i-k];
```

```
            max_sum = Math.max(max_sum, window_sum);
```

```
        }
```

```
        System.out.println("the maximum sum is: " + max_sum);
```

```
    }
```

```
}
```
